Comprehensive Report on Emerging Technologies

Prepared by:

Dela Peña, Ma. Carmela L.

Course:

BSCS-3B

Instructor:

JohnEros Puyo

Date:

September 12, 2026

Introduction

In this society, technologies changes many things. Our lives changes such as work and how to communicate with each other. It is called Emerging Technologies. Artificial intelligence, Augmented Reality and other smart device who are still developing and evolving. Because of this it can make our work easier, it can have a good services to us like education etc but it can have a disadvantage that's why we need to know what is this, how to use it and also we need to understand it carefully.

1. What are emerging technologies?

The emerging technologies is the new and still developing. It can change our lives, negotiations, industry etc. They can be somewhat established technologies that are further improved upon such as Artificial Intelligence (AI) which was first developed in the 1950s and is now seen as a disruptive technology.

2. Five Characteristics of Emerging Technologies

Characteristics	Description	Example
Radical Novelty	Presents fundamental new ideas or new approaches that apply these ideas.	The use of artificial intelligence on our phones to help us unlock our phone when recognizing the owner's face or help answer questions when the user speaks to it.
Relatively Fast Growth	Rapid increase in technological advances, including research, investment, and application.	Our cell phones and the applications we use on a daily basis.
Coherence	Emerging technologies should be considered as a whole, as interconnected systems and components that work together.	Social media platforms tend to be interconnected and include many components such as internet access, the ability to upload pictures or videos, and the ability to send and receive messages.
Prominent Impact	Technologies changes the industries and people's lives.	Online Payment - It's changes how to pay bills online, instead of going in physical bank.
Uncertainty and Ambiguity	This is not a perfect but we don't know what are the effects of this in the future and this is still developing.	Driverless cars are currently being developed but have yet to be fully tested.

3. Main Areas of Emerging Technologies

Below are the main areas of emerging technologies:

3.1 Augmented Reality

It is a technology that enhances existing reality by superimposing additional digital information, such as graphics, sounds, and text. In other words, users are able to see the real world with computer-generated elements added to it.

The examples of AR applications are Pokémon GO, car GPS systems, and apps that allow users to see how furniture would look like in their house. It has the capacity to relay important information to employees in real-time and provide a better experience for customers.

3.2 Artificial Intelligence

It refers to systems that simulate human capabilities, such as learning, reasoning, and problem solving. Furthermore, artificial intelligence enables machines to adjust their behavior in response to information acquired from their environment.

One of the branches of AI, which allows systems to recognize patterns is machine learning. The best examples of artificial intelligence are voice assistants, medical diagnosis systems, and recommendation algorithms.

3.3 Quantum Computing

Unlike classical computers that use bits, quantum computers utilize qubits to perform operations and store information. They have the ability to occupy positions of 0 and 1 at the same time, which makes quantum computers exponentially more powerful than any supercomputer.

This technology can be used to design new medicines and materials and to model physical phenomena, such as the interactions of atoms and molecules. Quantum computers are being built by companies like IBM and Google.

4. The Fourth Industrial Revolution

Stage	Time	Main Technology
1.0	18th Century	Steamed and Machines
2.0	19th Century	Electricity and Mass Production
3.0	1900's	Computer and Electronics

4.0	Now	IoT, AI, AR, Smart System
-----	-----	---------------------------

4.1 Key technology in Industry 4.0

- Big Data Analytics - Collecting and learning for many information to find a pattern and to use to make a easier and faster decisions.
- IoT - Everyday used like lights, machines, and any things that connected to internet to talk to each other.
- Cloud Computing - Saving and using data.
- Augmented Reality - Giving information to a workers/employees while they're working.

5. Effects of Emerging Technology

GOOD EFFECT

- Can make our work faster and easier.
- Creates new jobs and new businesses
- It helps health care, education and our lives to improve services.
- It connects people.

BAD EFFECT

- Some people lose their jobs.
- Private information can be stolen.
- People become lazy.
- Hard to work without technology.

6. Recommendations

For clients of TechVision Consulting Inc., here our simple suggestions;

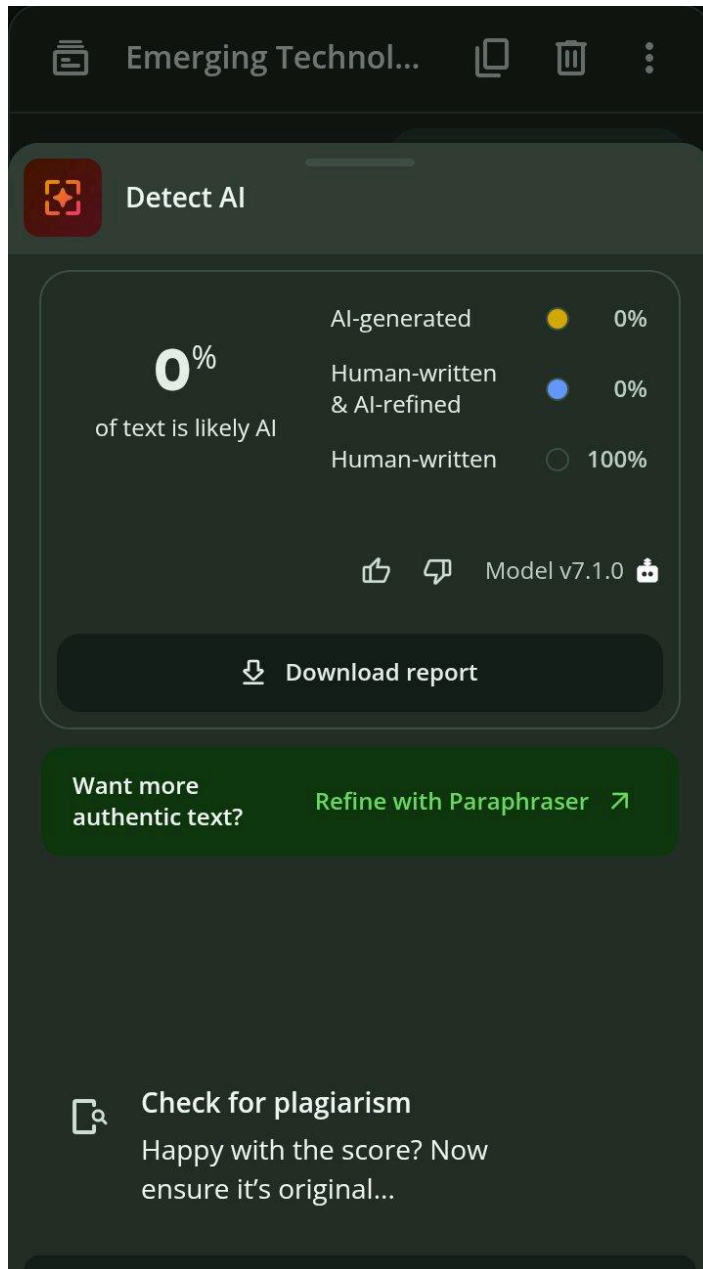

1. Teach the team new skills - it cant replace people with technology.
2. Start small - try one technology first before using it everywhere and be careful using it.
3. Protect data- always think and check privacy and security.
4. Be ready in emerging - it can faster developing technologies so be ready before too late.

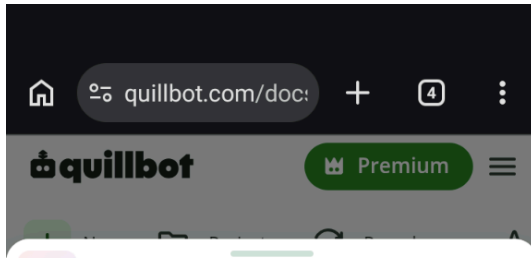

7. Conclusion

The emerging technologies like AI, AR, Quantum computing and IoT is changing our world fast. It can bring many chances so our life make easier but it can also bring challenges to us like jobs and our skills and privacy risk. We don't need to fear to it, we need to understand, how to use them correctly and we need to be ready for what comes next.
